Colorado, Boulder, USA

Collaborations (2)

Applications

Given good images, what can be achieved?

- Bone (osteoclast and precursor cells)
- Placenta (syncytiotrophoblast)
- *C. elegans* (localization of HSP::16.2)

Osteoclast Quantification (1)

Osteoclasts are bone-resorbing cells in marrow whose pathology is implied in osteoporosis & rheumatoid arthritis. **We have built a system to segment & quantify osteoclasts in culture.**

Figure 1: Automated image analysis of osteoclasts in culture. A: Immunofluorescence image (overlay) of OC and precursor cells. Red = F4/80 macrophage marker. White = alpha-tubulin and calcitonin-receptor. Blue = nuclei. B: Detection of all cells by the automated system. C: Identification of the OC among those cells.

Figure 4: Image analysis of a whole sample-region consisting of 100 (10 x 10) FOVs. A: Immunofluorescence image. B: Result of cell segmentation and analysis: non-OC are marked in white, OC are marked in red.

Syncytiotrophoblast (1)

Primary chorionic villi

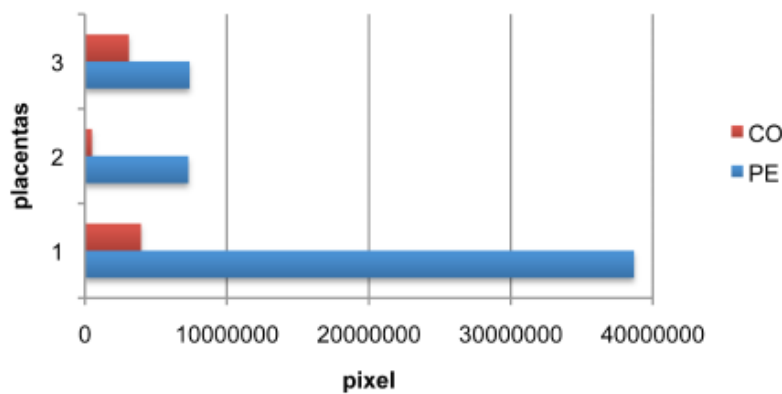

Syncytiotrophoblasts are multinucleated cells within the placenta of embryos at the surface of chorionic villi. Chorionic villi are part of the border between maternal and fetal blood during pregnancy. **We have built an IP system to segment villi & syncytiotrophoblast and applied it to RAGE quantification.**

Syncytiotrophoblast (2)

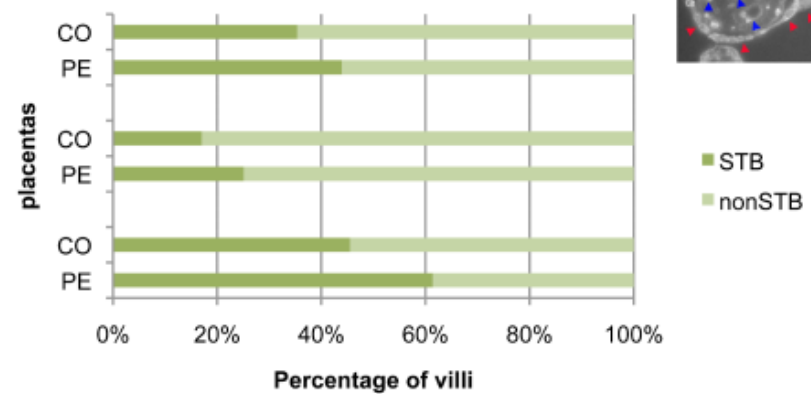

Total amount of RAGE

8

Localization of RAGE

10

Figure 8-10

The total amount of RAGE proteins quantified in PE and CO placentas is shown in Figure 8, respectively localization within the villi in Figure 10. RAGE can be found in STB (red arrowheads) or other cell types (blue arrowheads) visualized in Figure 9.

C. Elegans Protein Localization (1)

Quantifying Phenotypic Variation...

Analyzing changes in appearance / phenotype...

in Isogenic Caenorhabditis elegans...

in small nematodes (worms) which all have the same genetic code (i.e. clones)...

Expressing Phsp-16.2::gfp...

which express a GFP reporter that binds to heat shock protein 16 (i.e. transgenic worms)...

by Clustering 2D Expression Patterns

by extracting 2D expression patterns that are independent of worm pose AND clustering these patterns using hierarchical clustering methods

C. Elegans Protein Localization (2)

Heat Shock Protein 16 - increases expression not only when organism is exposed to high temperatures

HSP are named by molecular weight (=16kD). Expressed in intestine and pharynx. Induced in response to heat shock or other environmental stresses.

Interacts with intracellular human beta amyloid peptide (Alzheimer plagues)

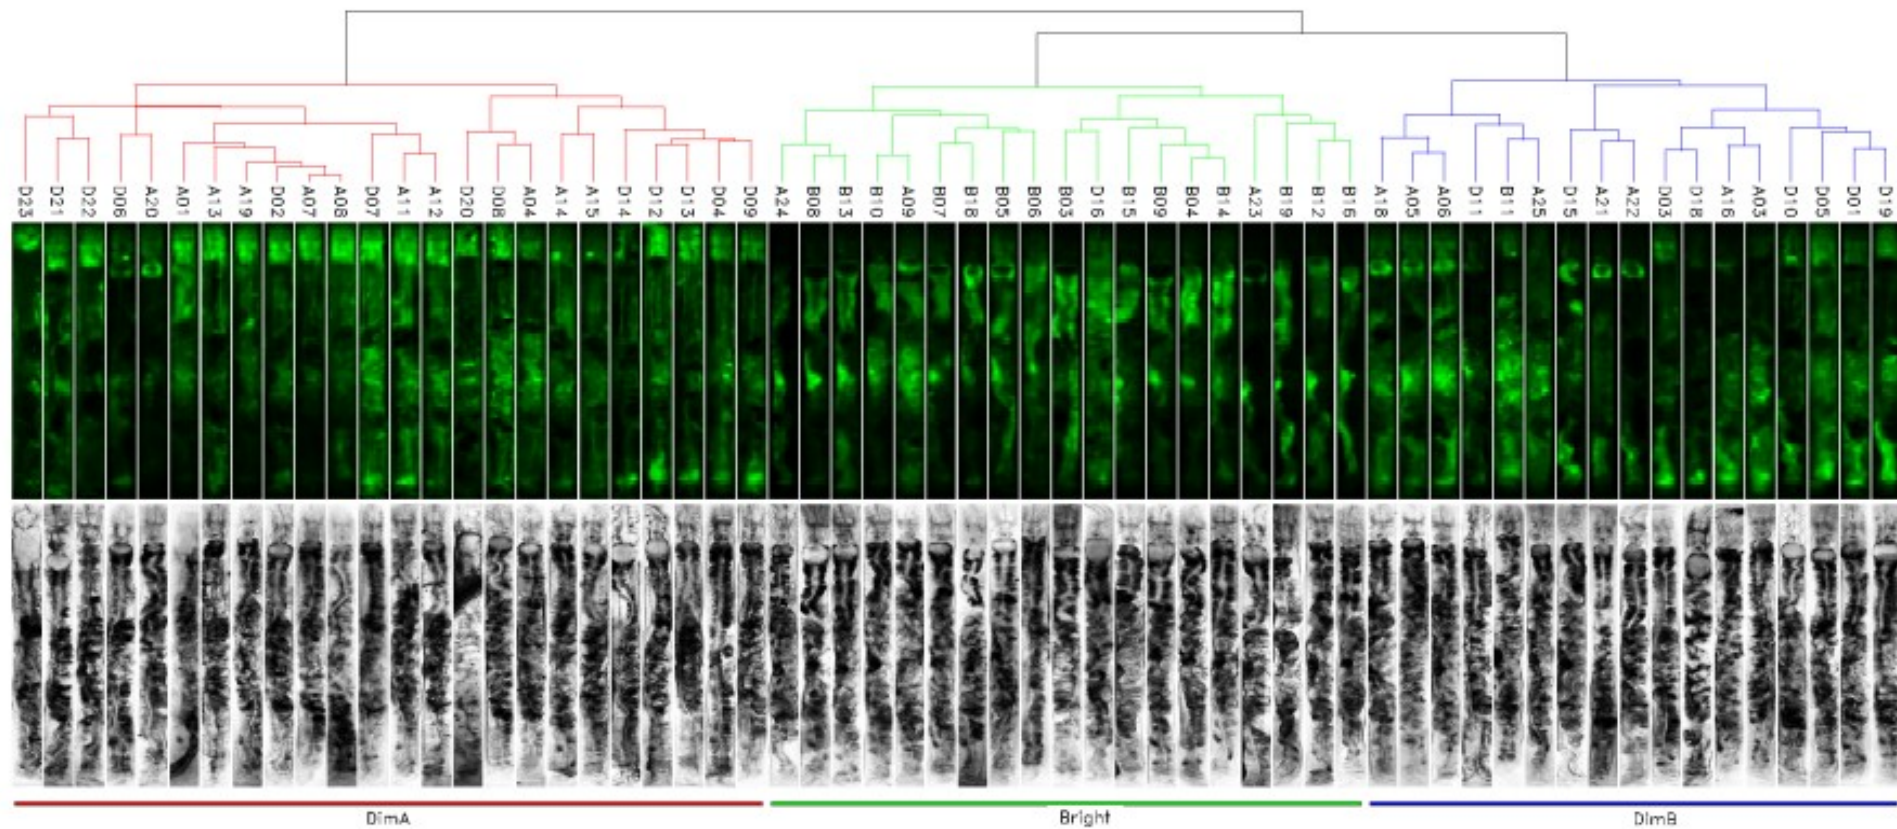

High expr. correlates with worm longevity acc. to earlier studies.

C. Elegans Protein Localization (3)

Seewald AK, Cypser J, Mendenhall A, Johnson T (2010) *Quantifying Phenotypic Variation in Isogenic Caenorhabditis elegans Expressing Phsp-16.2::gfp by Clustering 2D Expression Patterns*, PLoS ONE 5(7): e11426. doi:10.1371/journal.pone.0011426.

Image Data Analysis

Recording good images for image processing

- Slide-based microscopy for high resolution
- Common pitfalls and how to avoid them
 - Uneven illumination
 - Acquisition parameters
 - Image formats
 - Staining...
- Ground truth markup
 - Why it is essential
 - What it can be used for
 - How to create it properly
- Erythrocyte removal using a trained system

Slide-based Microscopy

Tissue features may span several FOVs or a higher resolution may be required.

Slide-based Microscopy uses a movable stage to move the tissue sample, recording hundreds or thousands of different parts of the tissue sample automatically.

These images need to be combined via stitching.

Stitching (1)

- *Stitching* analyzes the overlap between adjacent images to determine more precise combination. **We developed our own algorithm during the FFG Bridge project.**

Stitching (2)

Uneven Illumination

- Camera setup, lamps, condenser, software correction is feasible, but should be avoided

Acquisition Parameters

Perfect!

Out-of-focus

Overexposed

Increased Red

Image Formats

Use only lossless formats (TIFF, PNG)!

Especially JPEG is to be avoided!

- Removes information not visible to human eye which is still useful to image processing
- Introduces artefacts on several levels

No normalization of input images!

Staining (1)

Staining tissue is a very complex process!

- Tissue characteristics (thickness, density, ...)
- Quality of antibodies (too old/new, wrong kind?)
- Crosstalk w/ multiple stainings

...

Staining (2)

Ground-Truth Markup (1)

Image processing systems should be designed by biological experts – not by computer scientists with some biological background! The way to do this is by creating ground-truth markup for all tasks!

- Time-consuming to create (~ hours to days)
- Markups from at least 2-3 experts needed

Very useful in many ways!

- Compute inter-expert variance (~ complexity)
- Properly validate ad-hoc IP systems
- Optimize parameters for ad-hoc IP systems
- Train IP systems w/o writing code ...

Ground-Truth Markup (2)

Creating Markups

- Use any painting program (Photoshop, GIMP, ...)
- Open original image, add new layer for markup
- Save in multi-layered format (TIFF, XCF)
- Digitizer tablets improve speed & accuracy
- Use „average“ images, not the best ones!

Inter-Expert Variance - Erythrocytes

Inter-Expert Variance - Syncytiotrophoblast

Inter-Expert Variance - Summary

Comparing agreement of expert IE vs. SD

Erythrocytes

Syncytiotrophoblasts

Erythrocyte Removal (1)

Erythrocytes have high autofluorescence. May lead to bad fluorescent measurements.

Using only ground-truth data, we „taught“ the computer to remove erythrocytes from images (Haartraining [Viola & Jones, 2001])

Erythrocyte Removal (2)

Training Data

3764 **erythrocytes** have been marked ... 2000 regions containing no **erythrocytes** (tissue, background) up manually as well as...
